Jamshed R. Tata : Hormonal Signaling and Postembryonic Development (Biotechnology Intelligence Unit)
before purchasing it in order to gauge whether or not it would be worth my time, and all praised Hormonal Signaling and Postembryonic Development (Biotechnology Intelligence Unit):

This monograph combines two very active research areas: that of cell signaling with that of the postembryonic development of organisms into their adult phenotype. The first part concentrates on hormone actions, signal transduction and the hormone regulation of transcription, whereas the second part discusses postembryonic development as a function of hormone signaling. Over 10,000 original research articles, reviews, and conference papers were screened for this book.
